Experiences

Finyon Global - Junior Backend Engineer September 2025 – November 2026

Tools: Java 17, Spring boot, React, TypeScript, MySQL, Github, Unit Testing (Mockito), Postman

- Developed and maintained robust API integrations with multiple third-party payment providers via RESTful APIs, ensuring secure and reliable transaction processing and directly increasing the number of payment methods available to merchants on the platform.
- Shipped merchant-level payout processor restriction across the platform's entire routing and fallback pipeline turning what used to require a manual code change and deployment to block a processor for one merchant into an instant, self-service action for operations, while closing the risk of that block being silently bypassed on retry.
- Eliminated a manual, DBA-dependent process by shipping a self-service IP whitelisting feature in the operations panel. What used to require a Slack request and DBA turnaround is now instant, reducing operational load on both engineering and DBA teams while preserving data integrity across two independently-transacted database schemas.
- Shipped bank-level exclusion controls for payout processors across the platform's routing and fallback pipeline, enabling operations to instantly self-serve blocking banks a processor cannot settle with, converting a failure previously caught only after provider rejection into one prevented upstream, with the safeguard consistently enforced across every fallback and retry path.
- Reduced payout risk exposure by implementing processor restriction and industry-type eligibility rules, preventing payouts from being routed to incompatible or unauthorized processors before they reach production.
- Delivered a feature that flags missing configuration at setup, before it can cause failures in live transactions. Making operations resolve the conflicts preventing customer facing errors and reduce the troubleshooting efforts.
- Designed and delivered merchant and payment-provider features that streamlined transaction flows and improved payment reliability.
- Built and refined UI components in TypeScript, creating user-friendly forms and interactive views that improved usability and supported business workflows.
- Created and maintained comprehensive unit tests using Mockito to validate new features, bug fixes and integration, improving code quality and reducing production defects.
- Author and optimize MySQL queries to resolve data inconsistencies, and support incident resolution and feature development.
- Diagnose and resolve complex issues across backend services and frontend interfaces, implement effective fixes, and validate functionality to ensure seamless system performance and user experience.
- Create and maintain Postman collections and test scenarios for API endpoints and document request and response examples.
- Produce detailed technical documentation for each payment provider integration, including API specifications, configuration steps, and usage examples, ensuring knowledge transfer and long-term maintainability.
- Participate in code reviews, maintain feature branches, and follow agile workflows to deliver incremental improvements and maintain high code quality.
- Collaborated directly with external payment providers to align technical specifications, troubleshoot integration challenges, and deliver seamless end-to-end payment experiences.

Civicom Pacific Corp. - Junior Software Engineer June 2024 – September 2025

Tools: Java EE, JavaScript, Vue.js, MySQL, Github, Hibernate, AWS EC2,

- Implemented new features across the application stack, translating product requirements into backend services and frontend components using Java EE and Vue.js.
- Troubleshooting and resolving production issues, addressing bugs, performance bottlenecks, and integration errors reported during testing and after deployment.
- Executes manual testing to ensure code quality and reliability.

- Optimized MySQL queries and stored procedures, performing updates and enhancements to improve data retrieval.
- Refactored frontend pages to Vue.js, improving code modularity and simplifying component reuse for faster feature delivery.
- Utilize Java for backend logic, services, functionalities, and models.
- Designed and implemented RESTful APIs to facilitate efficient data fetching and integration between disparate internal systems.
- Developed a front-end monitoring tool to visualize employee task and attendance scores, enabling managers to track performance and identify discrepancies in real time.
- Contributed to CRM integrations, assisting with Salesforce and Microsoft Dynamics CRM connectivity and data synchronization with internal systems.
- Provisioned and configured cloud infrastructure, creating AWS EC2 instances, accessing them via PuTTY, and installing WildFly to host Java applications.
- Collaborated in Agile team processes, participating in sprint planning, stand-ups, code reviews, and design discussions to align implementation with business needs.

Xtreme Offshore Outsourcing - Junior Software Developer April 2024 – May 2024
Tools: ASP.NET Core (Razor Pages and Blazor Components), VB.NET, SQL, Git, Bootstrap

- Learned the basics of ASP.NET Core for web development and VB.NET.
- Participate In code review and studying VB.NET projects and contribute in providing solutions to integrate new features to the system.

IT Trainee February 2024 – March 2024
Tools: Java, ReactJS, NodeJS, WordPress, MySQL

- Learned multiple frameworks and technologies to contribute to small projects.

iPhitech IT and Digital Solutions - Web Developer Intern
Tools: PHP Laravel, WordPress, Shopify, JavaScript, ReactJS, MySQL, Bootstrap CSS

- Created sample webpages using WordPress, Shopify and Laravel based on the given UI design.
- Developed skills on different technologies used in Web Development.

Education

Polytechnic University of the Philippines (Taguig Branch) - Bachelor of Science in Information Technology
Capstone Project (Thesis) - Full Stack Developer
Tools: PHP Laravel, Bootstrap CSS, Github, JavaScript, Laravel Livewire, MySQL, Agile Methodology

- Developed and deployed a Web-based Alumni Portal System enabling efficient alumni information management, report generation, and digital form handling.
- Led the design and normalization of the MySQL database schema, ensuring data integrity and optimized query performance for large datasets.
- Utilized Laravel Livewire to build a dynamic, real-time frontend experience, reducing page reloads and improving user engagement without the overhead of a full JS framework.
- Acted as the primary technical contact for the client, translating complex business requirements into technical specifications and integrating feedback through rapid prototyping.
